Sprint-1

Date	11 november 2022
Team ID	PNT2022TMID42771
Project Name	Signs with Smart Connectivity for Better Road Safety.

Sprint Goals:

- 1. Create and initialize accounts in various publicAPIs like OpenWeather API.
- 2. Write a Python program that outputs results given the inputs like weather and location.
- 3. Extract data from OpenWeatherMap using APIs
- 4. Send the extracted data to the cloud.
- 5. Receive data from the cloud and view it in the python compiler.

Python code:

weather

This file is a utility function that fetches the weather from OpenWeatherAPI. It returns only certain required parameters of the API response.

```
Import requests as reqs

def get(myLocation,APIKEY):
    apiURL =f"https://api.openweathermap.org/data/2.5/weather?q={myLocation}&appid={API KEY}"

responseJSON =(reqs.get(apiURL)).json()

returnObject = {"temperature" : responseJSON['main']['temp'] - 273.15,

"weather" : [responseJSON['weather'][_]['main'].lower() for _ in

range(len(responseJSON['weather']))],

"visibility" : responseJSON['visibility']/100, # visibility in percentage where 10km is 100% and 0km is 0%

}

if("rain" in responseJSON):

returnObject["rain"] = [responseJSON["rain"]][key]

for key in responseJSON["rain"]]

return(returnObject)
```

brain.py >

This file is a utility function that returns only essential information to be displayed at the hardware side and abstracts all the unnecessary details. This is where the code flow logic is implemented.

```
import weather
from datetime import datetime as dt
# IMPORT SECTION ENDS
# UTILITY LOGIC SECTION STARTS
def processConditions(myLocation,APIKEY,localityInfo):
weatherData = weather.get(myLocation,APIKEY)
finalSpeed = localityInfo["usualSpeedLimit"]if "rain" not in weatherData else
localityInfo["usualSpeedLimit"]/2
finalSpeed = finalSpeed if weatherData["visibility"]>35 else finalSpeed/2
if(localityInfo["hospitalsNearby"]):
# hospital zone
doNotHonk = True
else:
if(localityInfo["schools"]["schoolZone"]==False):
# neither school nor hospital zone
 doNotHonk = False
else:
# school zone
  now = [dt.now().hour,dt.now().minute]
  activeTime = [list(map(int,_.split(":"))) for _ in
localityInfo["schools"]["activeTime"]]
   doNotHonk = activeTime[0][0]<=now[0]<=activeTime [1][0] and
activeTime[0][1]<=now[1]<=activeTime[1][1]
```

```
return({
  "speed" : finalSpeed,
  "doNotHonk" : doNotHonk
})
```

main.py

The code that runs in a forever loop in the micro-controller. This calls all the until functions from other python files and based on the return value transduces changes in the output hardware display.

```
# USER INPUT SECTION ENDS

# ------

# MICRO-CONTROLLER CODE STARTS

print(brain.processConditions(myLocation,APIKEY,localityInfo))

""

MICRO CONTROLLER CODE WILL BE ADDED IN SPRINT 2 AS PER OUR PLANNED SPRINT SCHEDULE
```

Output:

```python

# Code Output {'speed':15.0, 'doNotHonk': False}

``
